MADRID 112

**Public warning &
information messages**

112

- **The public warning and information messages system was created to be used in long emergency situations.**
- **It is activated when required by the emergency resolution managers.**

112

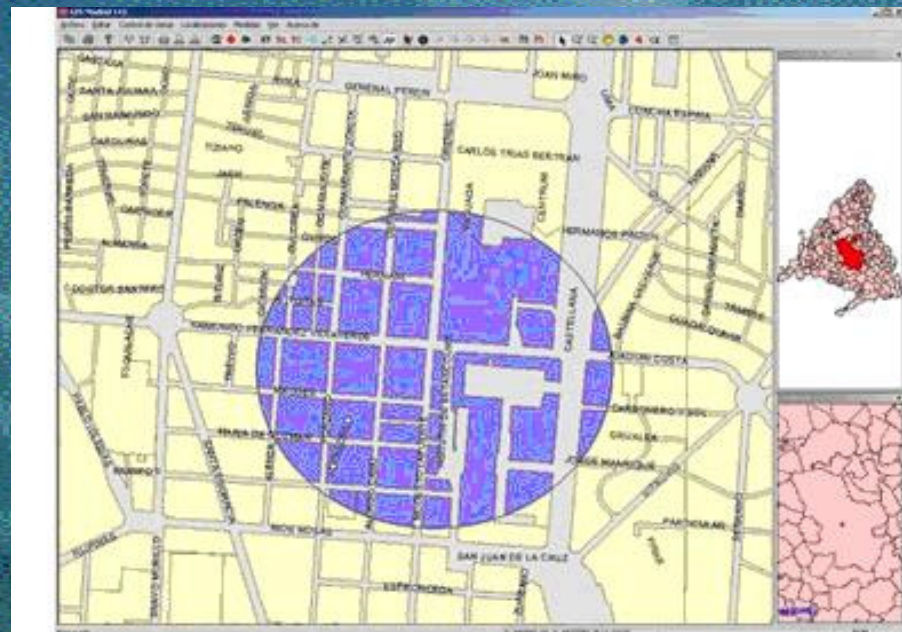

- There is a facility in the GIS that enables to draw a circle around the area where the warning is to be broadcast.
- Following this, a message is recorded and sent to all phone numbers located in this area.

112

- An example of its use was the fire of the "Windsor" skyscraper, located in Madrid's financial district.
- It was decided to warn the people in a 500 meters radius.
- They were asked to close their windows and blinds to avoid inhalation of toxic fumes.
- The message was sent to about 10.000 subscribers.

112

- The 500 meters radius was drawn using the GIS' capability and the subscribers list was created by the system.

112

- This facility is also useful for other, more common situations.
- The co-ordination centre warns the villages and towns in the region of Madrid about exceptional weather conditions via this system.

112

Thank you for your attention!!!
